## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 7\_Q1

Attempt : 1

Total Mark : 10

Marks Obtained : 6.5

### Section 1 : Coding

#### 1. Problem Statement:

Rajiv is analyzing the energy consumption in his household and wants to calculate the total cost based on the daily energy usage. He is given the rate per unit of electricity and the energy consumed for multiple days. To structure this calculation efficiently, he decides to use an interface-based approach.

Implement an interface CostCalculator with the necessary methods to retrieve energy details and compute the cost. The calculations should be handled in the EnergyConsumptionTracker class, while the EnergyConsumptionApp class should only handle input and output.

#### Formula

Energy Cost for one day = Energy Consumed per day \* Rate Per Unit

### ***Input Format***

The first line of input consists of the rate per unit as an 'R' (a double value).

The second line of input consists of the number of days 'N' (an integer).

The third line of input consists of the daily energy consumption values for each day 'D' (double values), separated by space.

### ***Output Format***

The first line of the output prints: "Day-wise Energy Cost:"

The next N lines of the output print the day-wise energy costs(double type) and the total energy cost (double type) in Indian Rupees in the following format: "Day [day\_number]: Rs. [energy\_cost]"

The last line of the output prints: "Total Energy Cost: Rs. [total\_cost]"

Note: energy\_cost and total\_cost are rounded off to two decimal points

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 0.01

3

10.0 20.0 30.0

Output: Day-wise Energy Cost:

Day 1: Rs. 0.10

Day 2: Rs. 0.20

Day 3: Rs. 0.30

Total Energy Cost: Rs. 0.60

### ***Answer***

```
import java.util.Scanner;
```

```
interface CostCalculator {  
    void getEnergyDetails(Scanner scanner);  
    void calculateAndDisplayCost();  
}
```

```
class EnergyConsumptionTracker implements CostCalculator {  
    private double ratePerUnit;  
    private int numDays;  
    private double[] dailyConsumption;  
  
    public EnergyConsumptionTracker(double ratePerUnit, int numDays) {  
        this.ratePerUnit = ratePerUnit;  
        this.numDays = numDays;  
        this.dailyConsumption = new double[numDays];  
    }
```

```
    @Override  
    public void getEnergyDetails(Scanner scanner) {  
        String line = scanner.nextLine().trim();  
        while (line.isEmpty()) {  
            line = scanner.nextLine().trim();  
        }  
        String[] values = line.split(" ");  
        for (int i = 0; i < numDays; i++) {  
            dailyConsumption[i] = Double.parseDouble(values[i]);  
        }  
    }
```

```
    @Override  
    public void calculateAndDisplayCost() {  
        System.out.println("Day-wise Energy Cost:");  
        double totalCost = 0.0;  
        for (int i = 0; i < numDays; i++) {  
            double cost = dailyConsumption[i] * ratePerUnit;  
            totalCost += cost;  
            System.out.printf("Day %d: Rs. %.2f%n", i + 1, cost);  
        }  
        System.out.printf("Total Energy Cost: Rs. %.2f%n", totalCost);  
    }  
}
```

```
class EnergyConsumptionApp {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
  
        double ratePerUnit = scanner.nextDouble();  
        int numDays = scanner.nextInt();  
  
        CostCalculator tracker = new EnergyConsumptionTracker(ratePerUnit,  
numDays);  
  
        tracker.getEnergyDetails(scanner);  
        tracker.calculateAndDisplayCost();  
  
        scanner.close();  
    }  
}
```

**Status :** Partially correct

**Marks :** 6.5/10

## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 7\_Q2

Attempt : 1

Total Mark : 10

Marks Obtained : 10

### Section 1 : Coding

#### 1. Problem Statement

Jaheer is working on a health monitoring system to help individuals calculate their Body Mass Index (BMI). He has implemented a basic BMI calculator and an interface called HealthCalculator. It should have a method called calculateBMI.

You are tasked with creating a program that takes weight and height as input, calculates the BMI using the BMICalculator class, and displays the result. If the height or weight is less than or equal to zero, then return -1.

Formula:  $BMI = \text{weight} / (\text{height} * \text{height})$

#### ***Input Format***

The first line of input consists of a double value W, the person's weight in kilograms.

The second line consists of a double value H, the height of the person in meters.

### **Output Format**

The output displays "BMI: " followed by a double value, representing the calculated BMI, rounded off to two decimal places.

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 70.0

1.75

Output: BMI: 22.86

### **Answer**

```
import java.util.Scanner;
```

```
interface HealthCalculator {  
    double calculateBMI(double weight, double height);  
}
```

```
class BMICalculator implements HealthCalculator {  
    @Override  
    public double calculateBMI(double weight, double height) {  
        if (weight <= 0 || height <= 0) {  
            return -1;  
        }  
        return weight / (height * height);  
    }  
}
```

```
class Main {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
  
        double weight = scanner.nextDouble();  
        double height = scanner.nextDouble();
```

```
BMICalculator bmiCalculator = new BMICalculator();  
double bmi = bmiCalculator.calculateBMI(weight, height);  
  
System.out.printf("BMI: %.2f\n", bmi);  
  
    scanner.close();  
}  
}
```

**Status :** Correct

**Marks :** 10/10
