Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

You are working as a developer for CityBank, which wants to build a basic account management system.

Each customer at the bank has:

An Account Number (integer)
A Customer Name (string)
An Initial Balance (double)

The bank allows two types of transactions:

Deposit – increases the balance.
Withdrawal – decreases the balance only if enough funds are available.

If the withdrawal amount is greater than the balance, the withdrawal should not happen, and the balance should remain the same.

You are required to implement this system using:

A class with attributes for account details. A constructor to initialize account details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customers.

Finally, display each customer's account details after all transactions.

Input Format

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the account number (integer).
- The following line contains the customer name (string).
- The next line contains the initial balance (double).
- The next line contains the deposit amount (double).
- The next line contains the withdrawal amount (double).

Output Format

For each customer, print the details in the following format:

1. Account Number: <account_number>
2. Customer Name: <customer_name>
3. Final Balance: <final_balance> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

1234

Rahul Sharma

5000

2000

3000

Output: Account Number: 1234

Customer Name: Rahul Sharma

Final Balance: 4000.0

Answer

```
// You are using Java
import java.util.*;
class acct{
    private int acctnum;
    private String custname;
    private double balance;
    public acct(int acctnum,String custname,double balance){
        this.acctnum=acctnum;
        this.custname=custname;
        this.balance=balance;
    }
    public void deposit(double amount){
        if(amount>0){
            balance+=amount;
        }
    }
    public void withdraw(double amount){
        if(amount>0&&amount<=balance){
            balance-=amount;
        }
    }
    public void display(){
        System.out.println("Account Number:"+acctnum);
        System.out.println("Customer Name:"+custname);
        System.out.println("Final Balance:"+balance);
    }
}
class main{
    public static void main(String[] args){
        Scanner sc=new Scanner(System.in);
        int n=sc.nextInt();
        for(int i=0;i<n;i++){
            int accno=sc.nextInt();
            sc.nextLine();
            String name=sc.nextLine();
            double initialbalance=sc.nextDouble();
            double depositamt=sc.nextDouble();
            double withdrawamt=sc.nextDouble();
        }
    }
}
```

```
        acct acc=new acct(accno,name,initialbalance);
        acc.deposit(depositamt);
        acc.withdraw(withdrawamt);
        acc.display();
    }
    sc.close();
}
}
```

Section 1 : Coding

1. Problem Statement

Neha is working as a developer for CityElectricity Board, which wants to build a household electricity billing system.

Each customer's electricity account has:

A Customer ID (integer) A Customer Name (string) Units Consumed (double)

The electricity bill is calculated based on these rules:

For the first 100 units 5 units charge per unit
For the next 100 units (101–200) 7 units charge per unit
For units above 200 10 units charge per unit
If the total bill exceeds 2000 units, a 5% discount is applied on the final bill.

Neha has been asked to implement this system using:

A class with attributes for customer details.A constructor to initialize customer details.Setter methods to update details if needed.Getter methods to retrieve details.Objects of the class to represent customers.

Finally, display each customer's details and final bill amount.

Input Format

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the Customer ID (integer).
- The following line contains the Customer Name (string).
- The next line contains the Units Consumed (double).

Output Format

For each customer, print the details in the following format:

Customer ID: <customer_id>

Customer Name: <customer_name>

Final Bill: <final_bill> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

1001

Ravi Kumar

80

Output: Customer ID: 1001

Customer Name: Ravi Kumar

Final Bill: 400.0

Answer

```
import java.util.Scanner;
```

```
class Customer {  
    private int customerId;  
    private String customerName;  
    private double unitsConsumed;  
  
    public Customer(int customerId, String customerName, double  
unitsConsumed) {  
        this.customerId = customerId;  
        this.customerName = customerName;  
        this.unitsConsumed = unitsConsumed;  
    }  
  
    public void setCustomerId(int customerId) {  
        this.customerId = customerId;  
    }  
  
    public void setCustomerName(String customerName) {  
        this.customerName = customerName;  
    }  
  
    public void setUnitsConsumed(double unitsConsumed) {  
        this.unitsConsumed = unitsConsumed;  
    }  
  
    public int getCustomerId() {  
        return customerId;  
    }  
  
    public String getCustomerName() {  
        return customerName;  
    }  
  
    public double getUnitsConsumed() {  
        return unitsConsumed;  
    }  
  
    public double calculateBill() {  
        double bill = 0;  
  
        if (unitsConsumed <= 100) {  
            bill = unitsConsumed * 5;  
        } else if (unitsConsumed <= 200) {  
            bill = unitsConsumed * 4.5;  
        } else if (unitsConsumed <= 300) {  
            bill = unitsConsumed * 4;  
        } else {  
            bill = unitsConsumed * 3.5;  
        }  
    }  
}
```

```

        } else if (unitsConsumed <= 200) {
            bill = (100 * 5) + ((unitsConsumed - 100) * 7);
        } else {
            bill = (100 * 5) + (100 * 7) + ((unitsConsumed - 200) * 10);
        }

        if (bill > 2000) {
            bill = bill - (bill * 0.05);
        }

        return bill;
    }
}

class ElectricityBillingSystem {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        int n = Integer.parseInt(sc.nextLine());

        for (int i = 0; i < n; i++) {
            int id = Integer.parseInt(sc.nextLine());
            String name = sc.nextLine();
            double units = Double.parseDouble(sc.nextLine());

            Customer c = new Customer(id, name, units);

            System.out.println("Customer ID: " + c.getCustomerId());
            System.out.println("Customer Name: " + c.getCustomerName());
            System.out.printf("Final Bill: %.1f\n", c.calculateBill());
        }
    }
}

```
